

Defect Management & Bug Lifecycle

Purpose:

To clearly define how the QA team identifies, tracks, triages, and closes bugs with transparency and ownership—ensuring higher product quality and efficient collaboration.

Defect Lifecycle Workflow (Jira)

Status Descriptions:

- **New:** Default backlog status when reported.
- **To Do:** QA confirms it needs triage.
- **Analysis:** Dev/BA investigates cause; determines validity.
- **In Progress:** Dev working on fix.
- **Testing:** QA validates the fix.
- **Closed:** Verified and completed.
- **Reopen (loop):** If test fails, bug goes back to "To Do" or "Analysis."

Priority & Severity Grid

Severity	Impact Scope	Example	Workaround?	Resolution SLA
Sev 1	Full system down, critical features broken for all users	App crash on launch, critical data loss	None	Immediate

Sev 2	Major feature fails, high user impact	Payment/Enrollment flow blocked	Manual option	48 hours
Sev 3-Crit	Important feature broken, partial impact	Fund transfers delay, report failure	Workaround	7 days
Sev 3-High	Moderate user impact, minor non-blocking features	Page load delay, link errors	Alt path	14 days
Sev 3-Med	Cosmetic bugs, affects few users	Misaligned icons, typos	Ignore	30 days
Sev 4	Non-urgent, visual/UI only	Color/theme issue, spacing	Ignore	90 days

Priority Levels:

- **P1 – Immediate**
- **P2 – Next release**
- **P3 – Backlog**
- **P4 – Low priority / future consideration**

Best Practices for Logging Bugs

Aspect	Guidelines
Title	Short, precise, and reflects issue area (e.g., Login page - OTP fails)
Description	State the issue clearly. Include module, platform, and test case ref.
Steps to Reproduce	Use clear step-by-step format with test data
Evidence	Add logs, screenshots, video recordings if possible
Expected vs Actual	Highlight difference between expected and actual behavior
Severity/Priority	Assign based on user impact and urgency (use grid above)
Assignment	Assign to respective developer, QA, or PO

Escape Defects vs Bugs

Type	Definition	Example
Bug	Code-level error detected in QA/dev	Clicking submit causes app to crash
Escape Defect	Bug missed in testing and caught in production	Enrollment fails in PROD, though it passed QA
