

2. Unite / Prime V3 Regression Suite – Overview

Purpose

The **Prime V3 Regression Suite** serves as the next-generation automation framework for the **Unite Enhancement (UE) and modernization projects**. It replaces the legacy Jenkins/TestNG setup (Prime V2) with a **GitLab CI/CD-driven automation pipeline**, leveraging **Maven dependency management** and **Nexus artifact repositories** for modular and scalable execution.

This suite is currently in **scheduled setup phase** and will form the baseline for **cross-platform regression automation**, covering enrollment, payments, notifications, and key API/UI workflows in **Prime Version 3**.

Status	Under Setup – Scheduled for activation
Owner	QA Automation & DevOps Team
Framework Version	Prime Version 3
Primary Scope	UE-related modules and end-to-end regression
Pipeline Orchestration	GitLab CI/CD
Build Management	Maven
Artifact Repository	Nexus
Execution Type	Scheduled & On-Demand
Reporting	Surefire + TestNG HTML (future integration with qTest)

Infrastructure Overview

Component	Technology / Tool	Purpose
Source Control	GitLab (Ascensus QA Automation Group)	Repository for Prime V3 regression codebase
Build Tool	Maven	Dependency management and build orchestration
Artifact Repository	Nexus	Versioned artifact publishing for regression binaries
CI/CD	GitLab Pipelines	Multi-stage regression execution (Build Test Report)
Reporting	Allure + TestNG Reports	HTML-based analytics and CI artifacts
Environment	Stage 1 (UE Projects)	Aligned with Unite Enhancement baseline
Trigger Type	Manual / Scheduled Nightly	Execution managed via GitLab cron jobs

Planned Regression Modules

#	Module / Feature Area	Status	Environment	Planned Runner	Linked Child Page (TBD)
1	Enrollment Flow – UE Projects	In Design	Stage 1	ParallelFeatureRunner	TBD
2	IDP Login Flow	In Setup	Stage 1	FeatureRunner	TBD

Execution Framework

Phase	Description
1. Build Stage	Maven compiles project, resolves dependencies, and pushes artifacts to Nexus.
2. Test Stage	GitLab pipeline triggers test execution using defined profiles (e.g., -Pue-regression).
3. Report Stage	Generates and publishes Allure/TestNG reports as GitLab job artifacts.
4. Sync Stage (Planned)	qTest integration for result synchronization (to match Prime V2 standards).

Integration & Visibility

- GitLab pipeline visibility enabled under:
Group: qa-automation/unite/prime-v3
Pipeline Name: UE-PrimeV3-Regression
Branch: main / release/ue
- Execution artifacts stored in **Nexus repository** for versioned traceability.
- All future Confluence child pages (module-level regressions) will follow the **Prime V2 layout standard** (Purpose Suite Info Execution Summary Observations Recommendations).

Next Steps

Action Item	ETA
Finalize GitLab pipeline YAML structure for V3 regression	Week 1
Integrate Maven goals (clean test -Pue-regression)	Week 2
Publish artifacts to Nexus and validate pipeline	Week 3
Add module-specific Confluence child pages	Ongoing
Establish nightly schedule for Stage1 UE regression	Post-validation

Roadmap

- Phase 1 – GitLab + Maven baseline pipeline setup
- Phase 2 – Module onboarding (Enrollment, CSR, Notifications)
- Phase 3 – Surefire/qTest integration
- Phase 4 – Parallel execution with unified reporting
- Phase 5 – Extend to additional UE projects and environments
