

3. Performance QA – End-to-End Lifecycle Flow & Architecture Overview

Page is about?

- Shows the **big picture** of Performance QA operations
- Helps new team members and partners understand the flow
- Clarifies who does what, when, and where
- Connects all Confluence pages through a single master diagram

1. What This Page Covers

This page illustrates the **complete flow of performance testing** from the moment a request comes in, all the way to reporting, dashboarding, and feedback into future sprints.

2. High-Level System Flow (Visual Diagram)

Use the following diagram as your **anchor image** for this page. This is **Confluence-ready** and can be uploaded as a static PNG /SVG or embedded via [draw.io](#).

System Flow Diagram:

- Intake / Request
- Requirement Gathering
- Test Planning & Scope Finalization
- Environment Readiness Check
- Script Development (YAML / JMeter)
- Test Data Setup (CSV, DB, API Tokens)
- CI/CD Integration (Jenkins / GitLab)
- Test Execution (Local, Jenkins, Blazemeter)
- Monitoring & Metrics (New Relic, Rancher, kubectl)
- Report Generation (HTML, Excel, Dashboards)
- Business Sign-Off & KPI Tracking
- Knowledge Archive (Confluence + GitLab + Slack Summary)
- Sprint Retrospective / Optimization Planning

3. Roles Across the Lifecycle

Phase	Role Responsible	Tools Involved
Intake	QA / Product / Release Team	Jira / Email
Planning	Performance QA Lead	Confluence SOP
Scripting	QA Engineer	Taurus, JMeter, GitLab
Execution	QA / CI Team	Jenkins, Blazemeter
Monitoring	DevOps + QA	New Relic, Rancher
Reporting	QA Analyst	Confluence, Excel, Slack
Sign-Off	QA Manager / Product Owner	KPI Sheet, Summary Report

4. Tool Stack Mapping

Stage	Tools	Notes
CI/CD	Jenkins, GitLab, YAML	Auto-trigger tests
Load Testing	Taurus, JMeter, Blazemeter	YAML-based scenarios
Monitoring	New Relic, Rancher, kubectf	APM + Pod Health
Reporting	HTML, Excel, Confluence	Auto-export + Slack Summary
Archival	GitLab, Confluence, Slack	All tests are documented

5. Best Practices Aligned with Flow

- Validate all YAMLs locally before pushing to CI
- Label every test with release name and app context
- Run baseline tests early in sprint soak/spike near UAT
- Keep test data sanitized (no real PII)
- Publish reports within 24 hours post-run
- Link all tests to confluence SOPs and team dashboards
