Executive Summary

This assessment inventories automated test assets for five Aha workstreams that define Universal Platform automation scope. It reports what is established, scheduled, and available for continued expansion — not requirement-level coverage percentages.

Workstreams assessed:

- Universal Enrollment — ACS-I-2679
- IDP / Authentication — ACS-I-2680
- ABLE — ACS-I-2681
- Angular — ACS-I-2682
- Withdrawal — ACS-I-2690

The automation team has established and maintains a substantial foundation across UI, API, and performance automation. Scheduled regression exists on both V2 and V3 frameworks, with additional assets implemented and ready for pipeline alignment.

V2 daily regression

- **Source inventory:** 744 total scheduled regression test cases in the qTest daily PRIME cycle.
- **UP-scoped inventory:** 268 cases mapped within the five-workstream Universal Platform scope, covering Enrollment, IDP/Web Login, LA ABLE, and Withdrawal.
- **Out of scope:** The remaining 476 cases support legacy, non-UP, or other out-of-scope areas and are intentionally excluded from the scoped subtotal.

V3 regression

- **Source inventory:** 436 total TestNG methods in the source regression reports (Universal Enrollment 303 + Unite suites 133).
- **UP-scoped inventory:** 379 methods directly mapped to Universal Enrollment, IDP Login, and Member Withdrawal for this assessment.
- **Adjacent inventory:** Additional V3 automation (57 methods in contributions, CSR account maintenance, and IDP web registration) exists outside the directly scoped subtotal.

Other inventory (reported separately)

- 6 ABLE Entity Platform scenarios (V3, implemented; not in scoped V3 subtotal).
- 22 Angular lib-ui component test definitions (separate from end-to-end automation).
- 11 unique in-scope API operations across Enrollment, IDP, and Withdrawal.
- 15 in-scope performance business journeys across Enrollment, IDP, Withdrawal, and ABLE Entity.

Requirement-level coverage percentages are not claimed. The Aha work items define high-level outcomes but do not yet provide an enumerated requirements baseline.

Current Automation Position

- Substantial scheduled UI regression on V2 and V3 across enrollment, authentication, withdrawal, and ABLE foundations.

- API automation implemented for enrollment, authentication, and withdrawal microservices.
- Performance journey assets available for enrollment, IDP, withdrawal, and ABLE entity flows.
- V2 Unite ABLE/CSR automation maintained across nine ABLE plans plus a dedicated LA ABLE suite.
- V3 ABLE Entity Platform and Angular lib-ui component automation implemented and available for pipeline enablement.
- Inventory-share percentages (36.0% V2, 87% V3) measure allocation of existing regression inventory to the five workstreams — not requirement coverage.

Scope and Counting Methodology

This assessment distinguishes source regression populations from UP-scoped inventory mapped to the five Aha workstreams. Source populations describe what the daily regression suites execute; scoped inventory describes what maps to Universal Platform scope for leadership reporting.

Population	V2	V3
Total source inventory	744	436
UP-scoped inventory	268	379
Non-UP / legacy / out-of-scope or adjacent	476	57

Counting units

Layer	Counting unit
V2 UI	Executed qTest test cases
V3 UI	Executed TestNG methods
API	Unique HTTP operations
Performance	Unique business journeys
Angular	Component/library test definitions

Counting units are reported separately and are not combined into a single overall total. Source populations are not presented as coverage totals.

Universal Platform Share of Existing UI Regression Inventory

Platform	Total regression inventory	UP-scoped inventory	UP share of inventory
V2 daily regression	744	268	36.0%
V3 regression	436	379	87%

These percentages represent the share of the existing UI regression inventory mapped to the five Universal Platform workstreams. They are not requirement-level coverage percentages. Requirement-level coverage cannot be calculated until the Aha work items contain an enumerated requirements baseline.

Leadership Dashboard

Scoped inventory by workstream. V2 and V3 UI counts reflect UP-scoped inventory only. API counts are unique operations. Performance counts are unique business journeys.

Workstream	V2 UI inventory	V3 UI inventory	API	Performance	Current position	Gap / opportunity
Universal Enrollment — ACS-I-2679	151	303	5 operations	7 journeys	Established scheduled automation across V2 and V3	Consolidation onto the target platform and continued business-flow expansion
IDP / Authentication — ACS-I-2680	27	56	4 operations	6 journeys	Established UI automation with API and performance foundations	API pipeline alignment and continued authentication-flow expansion
ABLE — Unite ABLE / CSR — ACS-I-2681	17 dedicated cases plus nine-plan parameterized coverage	Not applicable	None identified	Not applicable	Established V2 foundation	ABLE-specific API automation and suite scheduling alignment
ABLE — Entity Platform — ACS-I-2681	Not applicable	6 scenarios	None identified	1 journey	V3 foundation implemented	Pipeline enablement and plan expansion
Angular — ACS-I-2682	Not applicable	22 component tests (reported separately from E2E)	Not applicable	Not applicable	Shared component automation implemented	Pipeline scheduling and future business-flow alignment
Withdrawal — ACS-I-2690	73	20	2 operations	1 journey	Established V2 and V3 UI automation with API/performance assets	API gate alignment and targeted expansion

Workstream Detail

Universal Enrollment — ACS-I-2679

The 303 V3 Universal Enrollment methods are mapped at the suite level to ACS-I-2679. The V2 enrollment inventory contributes 151 additional UP-scoped cases. Together, enrollment automation spans standard, continue, multi-beneficiary, Upromise, PAGSP, matching-grant, and negative enrollment flow across multiple plan variants.

API: 5 unique enrollment/account operations. Performance: 7 enrollment business journeys.

IDP / Authentication — ACS-I-2680

The scoped inventory includes 56 V3 IDP Login methods and 27 V2 Web Login cases. Other registration suites remain outside the scoped totals used in this assessment. Authentication flows include login, logout, forgot username, and forgot password.

API: 4 unique authentication operations. Performance: 6 IDP-related business journeys.

ABLE — ACS-I-2681

Part A — Unite ABLE / CSR (V2)

Established V2 automation includes 17 dedicated LA ABLE cases, nine ABLE plans (AKB, COB, ILB, MIB, NHB, NYB, PAB, RIB, TNB), and parameterized coverage embedded in the V2 regression framework. CSR-Able enrollment, profile maintenance, contributions, withdrawals, fee, P&E, and share adjustment flows are represented.

Part B — Entity Platform (V3)

Six Entity Platform scenarios cover entity registration and entity dashboard login for MIB, NEB, and VAB. This foundation is implemented in V3 and available for continued regression expansion and pipeline alignment.

No ABLE-specific API automation was identified in the reviewed repositories.

Angular — ACS-I-2682

The current Angular inventory consists of 22 lib-ui dynamic-forms component test definitions. These are component/library tests and are not presented as end-to-end business-flow coverage.

Withdrawal — ACS-I-2690

The scoped inventory includes 73 V2 withdrawal cases, 20 V3 member-withdrawal methods, two unique API operations, and one performance journey. Coverage spans member and CSR distributions and systematic withdrawal flows.

Current Automation Strengths

- 744-case V2 daily regression provides broad legacy and modern plan coverage maintained on a scheduled cadence.
- 436-method V3 regression suite represents the strategic modern platform with 379 methods directly scoped to UP workstreams.
- Dual-framework coverage for enrollment, authentication, and withdrawal enables continuity during platform transition.
- Nine ABLE plans plus dedicated LA ABLE suite on V2; Entity Platform foundation on V3.
- Eleven unique API operations and fifteen performance journeys provide multi-layer automation beyond UI regression.
- Twenty-two Angular lib-ui component tests support shared UI quality for dynamic forms.

Current Gaps and Improvement Opportunities

Area	Current state	Gap / improvement opportunity
ABLE-specific API automation	No ABLE-specific API operations identified	Net-new API automation is required
ABLE Entity Platform	Six V3 scenarios implemented	Pipeline enablement and plan expansion
Angular lib-ui	Twenty-two component tests implemented	Scheduled pipeline enablement and ongoing component expansion
API automation	Eleven unique in-scope operations implemented	Align automated operations with standard scheduled API gates
Performance automation	Fifteen in-scope business journeys available	Confirm recurring scheduling, workload standards, and SLA governance
V2/V3 alignment	Automation exists on both frameworks	Continue consolidation toward the strategic target platform while preserving regression coverage
Requirement traceability	Aha work items define high-level outcomes	Enumerated requirements would enable requirement-level coverage measurement

Interpretation and Measurement Boundaries

- V2 contains broader legacy and non-UP regression that is intentionally excluded from the 268-case scoped subtotal.
- V2 and V3 are separate platform inventories and may contain functional overlaps; they are not summed.

- UI, API, performance, and component tests use different counting units and are reported separately.
- The published 36.0% and 87% values measure inventory allocation, not requirement coverage.
- Requirement-level coverage percentages require an enumerated requirement baseline from the Aha work items.
- ABLE Entity Platform (6 scenarios) and Angular lib-ui (22 component tests) are reported separately from the V3 scoped UI subtotal of 379.

Conclusion

The assessment confirms a substantial and actively maintained automation foundation across the five Universal Platform workstreams. The current inventory provides a measurable baseline for future expansion, consolidation, and requirement-level traceability once an enumerated requirements baseline is available.
