

03b. IntelliJ: Local Setup - Prime Automation – Parent Index (v2 & v3)

Page is about?

Purpose: Single landing page for Prime Automation onboarding. Choose the correct path (v2 or v3), review prerequisites, and complete the stepbystep setup. This page also centralizes FAQs, support contacts, and change history.

Quick Links

- **PRIME v3 – Local Automation Setup (IntelliJ + Maven)**
<https://confluence.ascensus.com/x/tykNF>
- **PRIME v2 – Local Automation Setup (IntelliJ/Eclipse + Ant)**
<https://confluence.ascensus.com/x/XyoNF>

Tip: Add a **Children Display** macro here (sorted by title) to autolist all onboarding subpages.

Which guide do I follow?

Use this if...	Prime v3 (Maven, Java 17)	Prime v2 (Ant, Java 8)
Build Tool	Maven (profiles, Nexus artifacts)	Ant (targets; manual JARs)
Java	17+	8
Dependency Mgmt	Nexus + settings.xml	IDE Project Structure add JAR folders
Typical Repos	prime-test-automation (v3), qa-resource, prime-parent	unite/astro/jett app folders + PRIME framework
Who uses it	New automation, v3 pipelines	Legacy suites still on v2

If you're not sure, check your team's pipeline/job definition.

Prerequisites & Access

- **Accounts:** GitLab, Nexus (read), Confluence, Teams.
- **Local tools:**
 - v3: **Java 17+**, **Maven 3.9+**, IntelliJ, Git.
 - v2: **Java 8**, **Ant**, IntelliJ/Eclipse, Git; local folders for cucumber/selenium/testng/groovy/prime JARs.
- **Credentials/config:**
 - v3: ~/.m2/settings.xml with Nexus servers & credentials.
 - v2: System environment variables (JAVA_HOME, ANT_HOME, SELENIUM_HOME, PRIME_HOME, etc.).

Security: Never commit personal host property files or secrets. Keep them untracked.

Onboarding Checklist

1. **Pick your guide** above (v2 or v3).
2. **Install Java & tools** per the guide.
3. **Clone** your automation repo (IntelliJ GetfromVCS, Git CLI, or SourceTree).
4. **Import the project** (Maven for v3; simple Java project for v2).
5. **Configure dependencies:**
 - v3: confirm Maven JDK=17; place settings.xml; let Maven resolve artifacts from Nexus.
 - v2: add PRIME/cucumber/selenium/testng/groovy folders as JAR **directories** in IDE.
6. **Create local config files** (host/environment properties).
7. **Build:**
 - v3: mvn clean install (or -P<profile>).
 - v2: ant cleanbuild (or ant, build_prime).
8. **Run tests:**
 - v3: Maven run config or rightclick TestNG XML; verify reports in target/surefire-reports.

- v2: bin Ant target or win script; verify reports under C:\Reporter.
9. **Verify Grid/WebDriver** locally (if running browsers on your machine).
 10. **Commit a smoke change** (e.g., update a readme) to validate your local remote flow.

Common Pitfalls & Quick Fixes

- **Maven can't resolve parent POM (v3)** Check ~/.m2/settings.xml and use mvn -U to force updates.
- **Missing classes (v2)** One or more library folders weren't added to the IDE Dependencies; readd JAR **directories**.
- **Chrome/Driver mismatch** Update ChromeDriver (v2) or let Selenium automanage (v3); remove stale drivers on PATH.
- **Wrong JDK** v3 requires **Java 17**; v2 requires **Java 8** (set both Project SDK and Maven JDK accordingly).
- **Host file ignored** Ensure file name matches machine variable and path is under the expected config directory; override via run parameters if needed.

Related References

- **Environment Setup** (v2): env vars, folder structure, drivers.
- **Compile & Run** (v2): Ant targets, runners, host.xml conventions.
- **IntelliJ & GitLab**: cloning/importing, SSH/PAT tips.
- **Automation Standard Practices**: coding style, data mgmt, locators, reporting.

(Keep these documents as child pages or link them in the **Related** section of each guide.)

Support & Ownership

- **Owners**: QA Automation – GS (Primary: Swapnil Patil; Backup: GS Automation Leads).
- **Ask for help**: Teams channel #qa-automation (tag @Automation Leads), or raise a **Jira** under project key QA.
- **Access requests**: Use the standard RT forms for **GitLab**, **Nexus**, **qTest**, and environment credentials.

Page Maintenance

- Review quarterly or after major pipeline/tooling changes.
- Keep the **comparison table** and **checklist** in sync with child pages.
- Archive deprecated instructions (mark with a *Deprecated* panel) and link to replacements.
