

Cursor AI: PRIME V3 - Local Automation Setup

About This Page

This guide provides **Cursor IDE-specific** setup steps for the **Prime v3 automation repo**, along with a dedicated **AI prompt library** to assist test automation and QA engineers working within **Cursor AI**.

*This page **excludes duplicate IntelliJ steps** like Java setup, Maven config, and Nexus settings.xml file placement. For those, please refer to the parent setup guide above.*

This is a companion page to: [Prime v3 IntelliJ Setup Guide](#)

Cursor AI-Specific Setup (Prime v3)

1. Clone the Automation Repository

Git URL: <https://gitlab.com/ascensus-gs/products/depot/qa-automation/prime-test-automation>

- **Option A:** Use Cursor's "Clone Git Repository" UI.
- **Option B:** Run in Cursor's terminal:

```
git clone https://gitlab.com/ascensus-gs/products/depot/qa-automation/prime-test-automation.git
cd prime-test-automation
```

2. Open the Repo in Cursor

- Go to **File > Open Folder** Select the cloned project folder.
- Accept **Maven auto-import** prompt (if shown).
- Verify the Java SDK is set to **Java 17** under Preferences > Java.

3. Required Plugins (Extensions)

Install these from File > Preferences > Extensions:

- **Maven for Java**
- **Cucumber for Java**
- **TestNG (optional)**

3. Host Properties Setup (Required)

Same as IntelliJ setup

- Go to: `src/test/resources/config/`
- Create a new file named `<HOSTNAME>.properties` (e.g., `MYPC123.properties`).
- Add required DB and browser settings (see full list in the [IntelliJ guide](#)).

4. Create Your Host Properties File

Path: `src/test/resources/config/`

Same as IntelliJ setup

- Go to: `src/test/resources/config/`
- Create a new file named `<HOSTNAME>.properties` (e.g., `MYPC123.properties`).
- Add required DB and browser settings (see full list in the [IntelliJ guide](#)).

*Do **not commit** this file to Git. Keep personal host config untracked.*

5. Build the Project

Project: unite-universal-enrollment

- Prereqs
 - Java 17 (LTS) on PATH: `java -version`
 - Maven 3.9+ on PATH: `mvn -v`
 - Chrome installed (for local Selenium runs)
- One-time setup
 - From project root: `mvn -DskipTests=true clean generate-resources`
 - Builds and unpacks docs/resources under docs/ and src/test/resources/
- Build (skip tests)
 - `mvn -DskipTests=true clean install`
- Run acceptance tests (default suite in bin/localhost.xml)
 - `mvn clean install -P acceptance-test`
- Alternate profiles
 - Stage1 UE regression: `mvn clean install -P stage1-ue-regression-test`
- Override environment
 - `mvn clean install -P acceptance-test -Denvironment.properties=stage1.properties`
- Useful locations
 - Reports: target/surefire-reports/ (HTML and XML)
 - Test data: src/test/resources/testsuite/...
 - Suites: bin/*.xml, bin/regression/daily/*.xml

AI Prompt Cheatsheet (Cursor Copilot)

Use these **ready-made prompts** inside Cursor AI to speed up development and debugging.

Test Execution

- **Prompt:** Run acceptance tests for this project.
- **Effect:** `mvn clean install -P acceptance-test`
- **Prompt:** Run stage1 UE regression.
- **Effect:** `mvn clean install -P stage1-ue-regression-test`
- **Prompt:** Build and skip all tests.
- **Effect:** `mvn clean install -DskipTests=true`

Cucumber Support

- Generate Cucumber step definitions for this feature file.
- Fix undefined Cucumber step for [step text]
- Add glue code param to TestNG suite XML

Suite/Env Overrides

- Run tests with bin/frontoffice/smoke.xml
- Run acceptance tests with stage2.properties file.
- Update acceptance-test profile to use custom XML.

CI/CD Support

- Add Maven profile for daily regression suite.
- Generate CI command for smoke profile in GitLab pipeline.

Debugging

- Analyze this TestNG failure and suggest a fix.
- Diagnose intermittent failure for this suite.
- Summarize root cause from this stack trace.

Cursor-Specific Tips

Task	Action
Auto Import Maven	Accept when prompted or + Shift + P "Re-import Maven"
Terminal	Open with Ctrl + backtick (`)

Search across Project	+ Shift + F
Agent Prompt	Highlight Right Click "Ask AI" or + I
Inline Suggestions	Use Tab to accept Copilot suggestions
Plugin Install	Use Marketplace under Settings Plugins

Final Notes

- All generic instructions (Java, Maven, Nexus, host properties) are located here:
[IntelliJ Setup for Prime v3](#)
- For Cursor AI installation:
[Cursor AI – Global Setup Guide](#)
- This page focuses only on **repo setup, prompts, and Cursor workflows**.
