

1. Automation Testing: Definition of Ready (DoR)

 Page is about?

Purpose

To ensure every backlog item is well-defined, technically viable, and ready for development and automation before it moves into "To Do".

Story Readiness Checklist:

- Story clearly defined in JIRA (Title, Description, ACs).
- Linked to Epic and labeled appropriately (e.g., @automation, @api, @performance).
- Technical Design is finalized and reviewed.
- Clear list of **Acceptance Criteria** (positive, negative, edge).
- Story has **impact areas and regression scope** noted.
- Dependencies (internal/external) identified and documented.
- Initial estimation & priority defined.
- Automation Squad has approved systematic or technical changes (if applicable).
- Story has an **Automation Readiness Indicator**:
 - Locator Strategy Clear (for UI).
 - API Contracts Available (if API story).
 - Mock/Test Data requirements identified.
- Security & Accessibility (ADA) implications considered (if relevant).
- Story written for smallest possible increment of value (split if needed).
- Reviewed in Kanban/Sprint Refinement session.

Quick Comparison: DoR vs DoD

Definition of Ready (DoR)	Definition of Done (DoD)
Ensures a story is ready to be picked up for development/testing	Ensures a story is fully complete and releasable
Focuses on clarity, completeness, technical prep	Focuses on quality, validation, coverage, and release readiness
Used before work begins (pre-sprint or pre-kanban-pull)	Used before closing the ticket or merging to main
Owned by Product + Tech Leads + Architects	Owned by QA + Developers + Product Owners

Workflow Mapping:

- **Shaping** All clarifications done, ready for grooming
- **Refinement** DoR criteria met
- **To Do** Ready to start coding/testing/automation
