

Universal Platform Test Automation – Angular Domain

Description

Description

Ensure adequate automated testing is available (not comprehensive) for **able, 529 and angular repos** enabling local execution and quality feedback to developers as well as enabling an automated CI/CD pipeline.

Route to **UX team**.

Details

- These tests **provide direct, responsive feedback to developers** when run locally without waiting on nightly test execution that run for hours on a remote host. Within reason, a single failing test case should not halt subsequent test case execution, but should fail gracefully, allowing later test cases to execute, and developers to receive the most/best feedback for troubleshooting errors.
- They also **enable a fully automated CI/CD pipeline** as quality gates from dev through production. If any of these tests fail, the automated CI/CD pipeline will halt, and the faulty artifacts will not be deployed. If they all pass, the CI/CD pipeline will execute to completion without human in-the loop / manual involvement and will result in a successful deployment to production.

Definition of Done

- Automated test cases are available and in working order supporting local execution by developers
- Automated test cases are available and in working order supporting execution by an automated pipeline
- Initial test cases are bundled and delivered to the ENVP team

Estimate

- To be provided by scrum team

Project Manager

Impact

- Developers can detect and respond to test failures more rapidly and earlier in the development process, reducing churn in the pipeline and delays in feature delivery (especially beneficial to remote/off-shore developers)
- Developers get more actionable and comprehensive feedback from test suite execution
- Developers will have access to execute fully automated CI/CD pipelines on-demand
- Generally enhanced productivity of scrum teams
- More frequent, reliable, stable, repeatable deployments
- Reduction/elimination of schedule impacts and costs associated with manual testing activities prior to production releases

Department Dependency

No Department Dependency selected

Client Service Impact (CSR)

No Client Service Impact (CSR) selected

Current Functionality

- Developers have access to few functioning test cases that can be executed locally or on demand, making developers reliant on test execution as part of long-running nightly jobs hosted remotely.
- CI/CD pipelines are halted to allow manual testing, QA approval, DB PR changes, and DBA sign-off.

Ideas Advanced TRY

Desired
Functionality

- Robust test cases are available to developers to run locally on demand.
- Test results are available in minutes rather than hours
- Test suite execution continues after failing test cases
- CI/CD pipelines can be fully automated with test cases serving as quality gates

Vendor
Requirements

Legal
Requirements

Risks Insufficient test coverage will increase the likelihood and impact of code being deployed to dev, test, and prod environments that are faulty, jeopardizing product quality, end user experience, and test environment stability. Delays in adoption may put the ENVP project milestones at risk.
