

Universal Platform Test Automation

Coverage Assessment

Prepared by: QA Automation

Date: 2026-06-29

Document status: Pending SME factual review

1. Executive Summary

This assessment inventories automated test assets scoped to five Aha workstreams: Universal Enrollment, IDP/Authentication, ABLE, Angular, and Withdrawal. It reports validated in-scope inventory separately from source regression populations.

The current Aha work items define high-level outcomes but do not contain an enumerated requirement baseline. This assessment therefore reports validated automation inventory and business-flow coverage rather than requirement-level coverage percentages.

Validated in-scope highlights

- **V2 scoped UI:** 268 executed test cases on V2 map directly to enrollment, IDP login, withdrawal, and LA ABLE.
- **V3 scoped UI:** 379 nightly TestNG methods on V3 map to Universal Enrollment (303), IDP login (56), and member withdrawal (20).
- **API:** 11 unique API operations across enrollment, IDP, and withdrawal modules.
- **Performance:** 15 performance business journeys across enrollment, IDP, withdrawal, and ABLE entity.
- **Angular components:** 22 lib-ui component test definitions (Angular library; separate from E2E flows).

Remaining work

- SME confirmation for adjacent suites (contributions, CSR, web registration, transfers).
- ABLE-specific API automation (net-new).
- Pipeline enablement for Entity Platform, lib-ui, and dedicated LA ABLE suite.

2. Scope and Counting Methodology

Source populations (not scoped totals): V2 qTest 744; V3 TestNG 436; API ~269 methods; Performance 36 JMX scripts.

Counting units are never mixed: qTest cases (V2), TestNG methods (V3), HTTP operations (API), business journeys (performance).

V2 and V3 are reported separately; framework overlap is not presented as unique combined coverage.

3. Leadership Dashboard

Workstream	V2 in-scope UI	V3 in-scope UI	API in-scope	Performance in-scope	Business flows	Current position	Remaining need	Ownership	Confidence
Enrollment (ACS-I-2679)	151	303	5 ops / 103 methods	7 journeys	Standard, continue, multi-bene, Upromise, PAGSP	Scheduled V2 & V3	V2 expansion mapping; consolidation	Galaxy + Automation	High
IDP (ACS-I-2680)	27	56	4 ops / 6 methods	6 journeys	Login, lockout, forgot user/pass	Scheduled V2 & V3	Web registration scope	Innovators + Automation	High
ABLE — Unite (ACS-I-2681)	17	—	None identified	—	CSR-Able dedicated suite; 9 plans in V2	V2 maintained; suite pending schedule	Schedule LA ABLE suite	Spurs + Automation	High
ABLE — Entity (ACS-I-2681)	—	6 scenarios	None identified	1 journey	Entity reg + dashboard login	Implemented V3	Pipeline enablement	Spurs + DevOps	High
Angular (ACS-I-2682)	—	—	—	—	22 lib-ui components	Implemented	Scope confirm; pipeline	UX + Automation	Medium
Withdrawal (ACS-I-2690)	73	20	2 ops / 98 methods	1 journey	Member/CSR distributions	Scheduled V2 & V3	Transfers scope; API gate	Infinity + Automation	High

4. Workstream Detail

Enrollment

V3 Universal Enrollment (303 methods) is fully aligned to ACS-I-2679. V2 enrollments module contributes 151 validated cases; additional PRIME expansion requires SME allocation.

IDP / Authentication

V3 IDP Login (56) and V2 web login (27) are in-scope. Web registration (46 V2, 6 V3) is adjacent pending confirmation against auth-server-only Aha scope.

ABLE (two components)

Part A: V2 Unite ABLE/CSR — 17-case dedicated LA ABLE suite plus 9-plan parameterized coverage.
Part B: V3 Entity Platform — 6 scenarios for MIB/NEB/VAB, not yet scheduled.

Angular

22 lib-ui dynamic-forms component tests are implemented. V3 contributions (36) and CSR (15) are adjacent until ACS-I-2682 scope is confirmed for member UI flows.

Withdrawal

V2 withdrawals (73) and V3 member withdrawal (20) are in-scope. V2 transfers (12) are adjacent.

5. Current Automation Strengths

- Substantial scheduled V2 and V3 UI regression across core Universal Platform flows.
- API automation implemented for enrollment, authentication, and withdrawal microservices.
- Performance journey assets for enrollment and IDP load testing.
- ABLE foundations on both V2 (Unite) and V3 (Entity) platforms.
- Reusable Angular lib-ui component test suite.

6. Gaps and Ownership

Gap	Recommended ownership
ABLE-specific API automation	
Adjacent suite scope confirmation	
V2 per-plan expansion mapping	
Entity Platform pipeline enablement	
lib-ui pipeline scheduling	
Performance SLA governance	

7. Limitations and Next Steps

- V2 qTest row-level IDs unavailable — module mapping is provisional.
- Adjacent suites excluded from scoped leadership totals pending SME validation.
- Enumerate Aha requirements to enable requirement-level coverage percentages.
- Complete Nick SME validation checklist before leadership distribution.
