

4:Execution Process Guide (Jenkins + Validation)

Purpose

Provide a clear, step-by-step reference for executing IDP Login performance tests via **Jenkins** and validating results. Ensures that offshore /onshore teams can run jobs consistently, capture reports, and verify SLAs without confusion.

1. Jenkins Execution Steps

1. Access Jenkins Job

- Navigate to: [AGSUP_ENDURANCE Jenkins Job](#)

2. Select Build with Parameters

- Click **Build with Parameters** to configure run inputs.

3. Enter Parameters

- **server** loadtestwt1 / loadtestwt2 (choose environment).
- **yaml** Path to Taurus YAML (e.g., idp/idp-login.yaml, idp/auth-server.yaml).
- **environment** stage1 (default).
- **encrypted** true (credentials handling).
- **concurrency** Number of virtual users (1, 10, 25, 50, etc.).
- **duration** Test length (1m, 10m, 30m, 1h, 8h).
- **ramp** Ramp-up time (1s, 30s, 1m).

Example 1 (Smoke Test):

- concurrency = 1, duration = 1m, ramp = 1s.

Example 2 (Baseline Run):

- concurrency = 25, duration = 30m, ramp = 30s.

Example 3 (Endurance):

- concurrency = 50, duration = 8h, ramp = 1m.

4. Trigger Build

- Click **Build** and monitor job status.

2. Validation Checkpoints

A. Jenkins Console Output

- Verify job starts with correct YAML/script.
- Confirm connections to server (auth successful, CSV data loaded).
- Check for immediate errors (timeouts, missing CSV, bad credentials).
- Look for BlazeMeter report link at the end of execution.

B. BlazeMeter Report Validation

- Open the BlazeMeter link (auto-generated in console).
- Validate key metrics:
 - Throughput (Hits/s).
 - Avg / 90% / 95% response time.
 - Error % (should be SLA threshold).
 - Assertions (login + account overview validation).

Example (from recent run):

- 25 VU for 57m.
- Throughput: **50.08 hits/s**.
- Avg Response: **404 ms**.
- 90% Response: **1142 ms**.
- Errors: **0.06%**.

C. SLA Compliance

Cross-check against SLA page (Child Page 1):

- **Pass** 95% requests < SLA response time, throughput SLA, error 1%.
- **Fail** SLA breach sustained > 5 mins, > 5% error, DB deadlocks detected.

3. Post-Run Documentation

- Record results in **BlazeMeter Baseline Reports page** (Child Page 5):
 - Run date/time.
 - YAML/script used.
 - Jenkins parameters (concurrency, duration, ramp).
 - BlazeMeter report link.
 - Pass/Fail summary.
 - Notable issues (assertion failures, deadlocks, infra errors).

4. Troubleshooting Quick Wins

- **CSV Errors** Ensure test data files updated & MFA disabled.
- **High Errors Early** Verify endpoint availability (stage1 not under deploy).
- **BlazeMeter Report Missing** Confirm - report flag in Taurus YAML.
- **DB Deadlocks** Escalate logs to DBA immediately; record timestamps for analysis.
