

Prime Application – User Access Recovery After DB Refresh

Environment: Stage 1 (Prod Refresh Source)
Audience: QA Automation, Manual QA, Leads, Admins
Applies To: All DB refresh events (Prod / Stage / Lower environments)

1. Problem Summary (What Broke)

After the latest DB refresh:

- **Prime automation user was missing**
- **All non-prod test users were wiped**
- Offshore users could not log in
- Automation jobs failed due to missing admin privileges

This is **expected behavior** after a Prod-based refresh.
What failed was **not having a documented recovery process**.

This page fixes that permanently.

2. Root Cause (Don't Overthink It)

- Stage 1 DB is refreshed from **Production**
- Production **does not contain test / offshore users**
- Roles & credentials are overwritten
- Automation users lose **admin permissions**

Conclusion:

User recreation + permission reset is **mandatory after every DB refresh**.

3. Standard Operating Procedure (SOP) – User Recovery

3.1 Step 1: Identify an Existing Admin Account

- If your personal account exists (from Prod refresh), use it
- If not, request **temporary admin access** via DB update (see Section 6)

3.2 Step 2: Login as Admin

1. Login to Prime application
2. Navigate to:
Admin Users

3.3 Step 3: Create a New User (Manual / Automation)

Example Test User

- **Full Name:** Venkatesh Mallela
- **Username:** vmallela
- **Email:** As provided
- **Role:** Based on requirement (Admin / CSR / Automation)

Steps

1. Click **Add New User**
2. Enter:
 - User ID
 - Username
 - Email address & other related info to create account
3. Assign appropriate **role/permission**
4. Save user

3.4 Step 4: First-Time Login Process (MANDATORY)

The user must do the following:

1. Go to [Unite CSR login page](#)
2. Enter:
 - **Username:** vmallela
 - **Password:** vmallela
3. Click **Login**
4. System redirects to **Change Password**
5. Enter:
 - Current password: vmallela
 - New password (per password guidelines)
6. Save and login again

4. Automation User Recovery (Critical)

Automation **will not run** without admin privileges.

Required Actions:

- Ensure automation user exists
- Ensure **Admin role is assigned**
- Reset password if needed
- Validate login manually before triggering pipelines

5. SQL – Force Admin Role Assignment (DB-Level Fix)

Use **only** if UI access is blocked or role is incorrect.

Admin Role Update SQL

```
update TA_SEC_CSR_ROLE
set ROLE_ID = '5300'
where CSR_ID in (
  select csr_id
  from ta_csr_logininfo
  where username = 'swpatil'
);
```

Notes:

- 5300 = Admin role
- Replace username as needed
- Requires DB access approval
- Log execution time & approver

6. When to Use SQL vs UI

Scenario	Use UI	Use SQL
Admin login works		
Admin user missing		
Role incorrectly assigned		
Emergency pipeline unblock		

SQL is **last resort**, not default.

7. Common Issues & Fixes (Troubleshooting)

Issue 1: User Exists but Login Fails

Cause: First-time password reset not done

Fix: Login with username = password reset password

Issue 2: Automation Fails Immediately

Cause: Automation user lost admin role

Fix: Reassign Admin role (UI or SQL)

Issue 3: Offshore User Can't Login

Cause: User wiped during refresh

Fix: Recreate user via Admin Users

Issue 4: User Created but Can't See Features

Cause: Incorrect role

Fix: Update role to correct permission level

8. FAQ (Answer These Once, Stop Repeating)

Q1. Do we need to recreate users after every DB refresh?

Yes. Always. No exceptions.

Q2. Can we automate this?

Not safely (security + audit constraints).

Manual + documented is the correct approach.

Q3. Why do offshore users disappear?

They **don't exist in Production**, which is the refresh source.

Q4. Should automation users live in Prod?

No. Admin role is re-applied post-refresh in Stage.
