

2. Automation Testing: Definition of Done (DoD)

This document outlines **clear criteria** for completing development, testing, and validation processes to ensure **high-quality software delivery**.

Page is about?

Purpose

The Definition of Done (DoD) defines the strict quality gate that every feature, enhancement, or bug fix must pass before it is considered "Done." It enforces **automation quality, traceability, and release readiness** to ensure seamless, defect-free delivery.

This updated DoD incorporates **QA, Automation, Performance, Security, CI/CD, and UAT standards**—aligning all automation engineers across teams.

1. Development Readiness

Criteria	Description
Acceptance Criteria Met	All story acceptance criteria are implemented and validated.
Unit Testing Done	80% code coverage for business logic using unit tests.
Peer Code Review	Reviewed by a Sr. Developer/Lead with comments addressed.
No Critical/High Defects	No Sev 1 or Sev 2 bugs open in Dev or QA environments.
Test Data Strategy	Relevant test data (static/dynamic) created for manual and automation runs.
Secure Coding Standards	Fortify/SAST/OWASP Top 10 issues resolved or documented.

2. Automated Testing Coverage

Criteria	Description
Automation Scripts Added	At least one positive, negative, and boundary scenario automated.
Automation Tags Maintained	Proper use of @Smoke, @Regression, @Sanity, @E2E annotations.
Regression Suite Updated	New changes integrated into existing automation suites.
CI/CD Integration Validated	Tests triggered via Jenkins/Azure pipelines in Dev/QA.
No Unexpected Failures	All automation suites pass with no flaky or ignored tests.
Allure/Extent Reports Generated	Test results stored & shared on Confluence or project tracker.

3. Manual & Exploratory Testing

Criteria	Description
Functional Testing Completed	Manual test cases executed and passed.
Regression Coverage Ensured	All related test cases for impacted modules validated.
Browser Compatibility Checked	Chrome, Firefox, Edge verified. Safari if applicable.
Mobile Responsiveness Tested	Responsive design tested (if feature applicable).
UX/ADA Review Completed	UX and accessibility reviewed or logged (WCAG 2.1 compliance).
E2E Flow Verified	If cross-module or backend involved, full workflow validated.

4. Performance & Security Validation

Criteria	Description
----------	-------------

Performance Benchmarks Met	Load/stress tests executed for API/UI (if applicable).
SLA Validations Done	No critical performance regressions or SLAs breached.
Security Test Completed	SAST/DAST or OWASP vulnerability testing conducted.
Data/File/API Validations	API contracts, encryption, and payloads validated.

5. Release Readiness

Criteria	Description
PO Demo Conducted	Product Owner reviewed and approved the story/demo.
UAT Sign-off	UAT tests executed and accepted (if applicable).
Release Notes Finalized	Functional & technical notes documented clearly.
CI Pipeline Green in All Env	QA, Stage, and optionally Production pipelines all passing.
Regression Passed in Lower Env	QA/UAT regression executed with success.
JIRA/Defect Logs Closed	All bugs linked to the story are closed/resolved.

6. Post-Release Verification

Criteria	Description
Prod Smoke Test Done	Key flows validated post-deployment.
Monitoring Active	Real-time alerting (APM/logging/dashboards) set up.
Post-Mortem Logged (if issue)	Any prod issues logged, RCA created.
Story Status Closed in JIRA	All tasks moved to 'Done' post-release.

Key Enforcement Policies

- **No “Done” without DoD:** JIRA will not be closed unless all DoD criteria are validated or waived with approval.
- **QA Sign-Off Mandatory:** Automation test report + manual test execution report must be attached.
- **Learning & Feedback Loop:** Retro or root cause analysis needed if post-release defects > 1 in same module.
- **Automation Evolution:** Regression coverage % should improve sprint-over-sprint.
